The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammacory steroid in a subject, for reducing evels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition, lung inflammation, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse; ss; Zace2; zinc metallopeptidase; ulcerative colitis; inflammation; inflammatory bowel disease; arthritis; enterocolitis; Crohn's disease; gene therapy; transgenic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   which specifically hybridises with and inhibits expression of phosphorylase kinase alpha-1 which specifically hybridises with and inhibits expression of phosphorylase kinase alpha-1. The compound of the invention is useful for inhibiting the expression of phosphorylase kinase alpha-1 in cells or tissues, and for treating an animal having a disease condition associated with phosphorylase kinase alpha-1, e.g. a metabolic disorder such as diabetes. The compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The antisense compounds are also useful as therapeutic, diagnostic and research reagent, for distinguishing functions of various members of a biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; phypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodiation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pathway, and in antisense gene therapy. The present sequence represents an antisense oligonuclectide probe used to create the phosphorylase
                                                                                                                                                                                                                                                                                                                                                                   New antisense compound which is targeted to nucleic acid encoding phosphorylase kinase alpha 1 and inhibits expression of kinase protein, useful for treating a condition associated with kinase, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel antisense nucleic acid compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

(ZYMO) ZYMOGENETICS INC

```
The invention relates to an isolated polypeptide, comprising fully defined human Zace2, murine Zace-5, or murine Zace2-10 polypeptide. An expression vector containing Zace2 polymucleotide is useful for producing Zace2 protein. The polymucleotide is useful for producing Cace2 protein. The polymucleotide is useful for producing cace2 protein. The polymucleotide is useful for decreasing inflammation associated with a condition such as inflammatory bowel disease, arthritis or enterocolitis. The polypeptide is useful for treating Crohn's disease and conference of the polypeptide is useful for treating Crohn's disease and angiotensin II, for identifying modulators of Zinc protease and for identifying angiotensin converting enzyme (ACE) inhibitors. The polymucleotide is useful in gene therapy techniques to treat the above mentioned disorders. The polymucleotide is also useful for determining whether a subject's chromosome contains a mutation in the Zace2 gene. The present sequence represents an oligonucleotide used to generate the 3' end of a DNA probe for the murine Zace2 gene
                                                                                      Isolated human or murine Zace2 polypeptide useful for reducing inflammation in conditions such as inflammatory bowel disease, arthritis, enterocolitis, ulcerative colitis and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MYC protein for antibody prepn. - is stabilised by converting aminoacid(s)(s) of MYC protein to other aminoacid to produce variant type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

```
The present invention involves a new method for identification and quantification of at least one pathogen in a sample. The method uses an improved quantitative one-tube fluorogenic real time polymerase chain reaction. In this process a very specific probe labeled with a reporter dye and a quencher dye hybridises with the target sequence. PCR primers are extended the exonuclease activity of the polymerase causes cleavage of the probe. This separation of the reporter dye from the quencher dye probe. The probe is a PCR primer used in the method. The invention includes primer and probe sequences for the detection of viruses, bacthod is useful for the detection of infectious agents. The method is useful for the detection of infectious agents, quantitation of mRNA expression and detection of genetic mutations
                                                                                                                                                           ó:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
produced in E. coli, B. subtilis, yeast or animal cells. It is stabilised by the variation in amino acid compsn. Which does not affect the properties of the myc protein. Myc protein can be used for prepn. of poly or monoclonal antibody
                                                                                                                                                            Gaps

controlly minimal deletions in the human FRA16D oxidoreductase (FOR) gene. The FOR gene encodes a cancer associated protein. The FRA16D site is a fragile site encodes a cancer associated protein. The FRA16D site is a fragile site induced by aphidicalin, which is located within the FOR gene. The fragile site is the location of breakpoints of a variety of chromosomal rearrangements, and other mutations associated with cancers. The FOR protein is expressed as unmber of splice variants. FOR gene polynucleotide fragments are capable of acting as specific primers or probes for detecting cancer associated variations of DNA sequence such as a point mutation or small DNA rearrangement associated with the tumour, a breakpoint of one or more chromosomal rearrangements associated with the tumour and a pause site within the FRA16 gene. FOR nucleic acid molecules are useful as markers to identify relationship between the fragile site (FRA16D) and the DNA instability in neoplasia which allows better
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;

The present invention relates to a method for mutation analysis (M) of the pol gene of human immunodeficiency virus (HIV)-1 isolates. The method comprises isolating a sample, extracting virion RNA or DNA of the cisolated sample material, amplifying the RNA or DNA through two cycles of isolated sample material, amplifying the RNA or DNA through two cycles of consted polymerase chain reaction (PCR), and sequencing the PCR product using at least one sequencing primer. The primer sequences of the invention (AAS17338-AAS17361) are useful for analysing the sequence of HIV pol gene of HIV-1 isolates. The method is fast, reliable, complete, and suitable for analysing mixed samples. The primer complete, and suitable for analysing mixed samples. The primer complete of the method reduces the analytical period since all mutations can be sequenced in a single laboratory format, avoiding the necessary step of additional cloning or resequencing part of the viral genome to identify all mutations related to drug resistance. Using the protocol of the method, the sequence of the sample is reliably determined on a single day. The method and the primer combination improve the monitoring of fund resistance, leading to improve management of AIDS formation improve the converse of the sample of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The invention provides isolated Toxoplasma gondii nucleic acids that encode immunogenic polypeptides. The T. gondii nucleic acid molecules, immunogenic proteins and antibodies to the proteins can be used to inhibit T. gondii oocyst shedding in a cat due to infection with T. gondii. They can be used for preventing T. gondii infection and for preventing T. gondii infection. They can also be used for detecting T. gondii infection. The detection method can be used for parasite cysts or occysts in feces, e.g. from enteric apicomplexa occysts such as Cryptosporidium occysts and Toxoplasma occysts. Sequences encoding immunogenic T. gondii proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting parasite occysts or cysts in feces, comprises eluting DNA from sample into aqueous solution by heating, amplifying DNA with primers specific for occysts or cysts being detected, and detecting amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic protein; oocyst; faeces; ss; enteric apicomplexa oocyst; Cryptosporidium oocyst; Toxoplasma oocyst; Giardia cyst; vaccine; oocyte shedding; PCR primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primers AAV42576-78 were used to find the transcription start site of the Arabidopsis thaliana meisosis-specific DMC1 gene (AtDMC1). The AtDMC1 promoter and homologues can be used to confer meiosis specific expression on a sequence operably linked to the promoter. They can be used for each ablation of meiotic cells and isolation of apomictic plants, designing an efficient homologous recombination system for plants, increasing meiotic recombination frequency, for introgression of allen chromosome segments into host plant, on altering normal events of cell cycle during the time of meiosis and producing male and female sterile plants. The promoters can also be used in searching for apomictic mutants or used by seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogenic protein, Toxoplasma gondii protein; oocyst shedding; cat; T. gondii infection; enteric apicomplexa oocyst; Cryptosporidium oocyst; Toxoplasma oocyst; RT-PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated Arabidopsis meiosis-specific promoter - useful for meiosis-specific transcription of genes, e.g. for isolation of apomictic plants or removing DNA from transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to detection of parasite oocysts or cysts in a faces sample comprising contacting the sample with a solid support, drying and then washing the sample with an aqueous wash solution, adding an aqueous elution solution and eluting DNA from the sample by heating and amplifying by PCR oocyst/cyst-specific DNA and detecting the amplifying by PCR oocyst/cyst-specific DNA and detecting parasite oocysts e.g., enteric apicomplexa oocysts such as Cryptosporidium oocysts or Toxoplasma oocysts, or for detecting parasite cysts e.g. diardia cysts. The method is also useful for developing vaccines to prevent oocyts shedding in cats. The present sequence is a PCR primer used to isolate DNAs encoding immunogenic proteins from Toxoplasma gondii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Animal models for human haematopoiesis - have en-grafted human or primate stem cells in the presence of immortalised bone marrow stromal cells.

Example 1; Page 27; 43pp; English.

AAT45736-T45753 are PCR primers used to determine whether or not certain cytokines (IL-1, IL-6, IL-8, GM-CSF, G-CSF, M-CSF, TGF-alpha and stem cell factor) are expressed by a human bone marrow srromal cell line, Lof(11-10). The primers were used in a PCR to identify genes encoding the cytokines. The cells were found to produce the cytokines which support the growth of CD34+ stem cells. The Lof(11-10) cells were injected into SCID mice (previously irradiated to provide an internal space for CD34+

cells to populate). Five to seven days after injection the mice were injected with 3 to 5 human CD34+ cells. After 3 weeks, human CD34+ cells were found in the bone marrow of the mice. The immortalised bone marrow stem cells create a human microenvironment supplying human cytokines in differentiation of provide for the engraftement, maintenance and administering Lof(11-10) cells are used to study and determine the effectiveness of therapies against disease such as HIV infection. They can also be used to assay for haematopoietic growth factors, 88888888888888

Detection of naive T cells in subjects - useful to identify production stimulating drugs for immunocompromised subject treatment.

Disclosure; Page 23; 56pp; English.

AAT46992-T47005 represent amplification primers for DNA encoding cytokines from CD8 T-cells. This sequence and AAT47005 are primers for the granulocyte macrophage colony stimulating factor gene. The naive subset of CD8 cells expresses the CD45RA surface marker, and make a relatively poor cytokine response after T-cell receptor stimulation. Naive T-cells are cells which have recently emigrated from the thymus and have a predominantly proliferative response when exposed to cognate antigens for the first time. These primers can be used in the method of the invention. The method of the invention is for evaluating the efficacy of a drug to stimulate the production of naive T-cells. The method comprises obtaining a sample containing peripheral blood mononuclear cells from a subject. A suitable dose of a drug is then administered

ö
              isolated from the samples. The number of naive T-cells in each population is then determined by detecting T-cell immunoreactivity with at least 2 antibodies, selectively reactive with naive T-cell surface proteins. If the number of naive T-cells in the second population is significantly greater than the number in the first, then the drug is identified as being effective. The method can be used to identify naive T-cell count elevating drugs, particularly in immuno-compromised subjects, e.g. HIV positive subjects, cancer patients or individuals with viral infection or autoimmune disease
                                                                                                                                                                                                                                                                                                                                                Gaps
second sample is obtained. The T-cell populations are then

encoded polypeptides, useful for preventing, treating or ameliorating atherosclerosis, as well as for immune or hyperproliferative disorders. New polynucleotides regulated by fatty lesion development and their encoded polypeptides, useful for preventing, treating or amelioratin

Claim 1; Page 152; 188pp; English.

fatty lesion development, which comprises any of 55 polynuclectide sequences from Oryctolagus cuniculus. The polynuclectide, polypeptide or antibody is useful for preventing, reeating, modulating or ameliorating a medical condition, particularly atherosclerosis. The invention is used as a marker or detector of nervous system disorder or disease (e.g. parkinson's disease, lackaemia, demential). The invention may also be useful for treating deficiencies or disorders of the immune system (e.g. lymphopaenia, leukocyte adhesion deficiency syndrome or haemoglobinuria, anaemia), hyperproliferative disorders present invention relates to an isolated nucleic acid regulated by

In the mouse, both alleles of a gene activated in early lymphocyte development are disrupted, causing it to lack mature B and T cells. In particular, both alleles of the recombination activation gene-2 (RAG-2) gene are disrupted, which in turn prevents VDJ recombination. The mouse also comprises donor (e.g., human) specific transgenes encoding the cytokines interleukin-7 (IL-7), stem cell factor (SCF), leukaemia inhibitory factor (ILF), granulocyte macrophage-colony stimulating factor (GM-CSF), macrophage-colony stimulating factor (M-CSF), and IL-6, which enable it to support the growth of transplanted donor cells. In another embodiment of the invention, the mouse comprises DNA encoding the human major histocompatibility complex (MHC) class II DR3 molecule, where the transgene has naturally linked DRab and DQab alleles. The transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transgenic mouse; immunodeficient; tissue recipient;

donor, e.g., non-human, macromolecules; to determine the effect compounds have on a human immune system; to generate fully human polyclonal or monoclonal antibodies will raise a response in a human immune system; to generate fully human polyclonal or monoclonal antibodies will raise a response in a human immune system; to investigate the human cell mediated response to pathogens and other immunomodulatory compounds; and to determine the factors involved in regulating the development and function of human chaematopoietic cells. The transgenic mouse supports the functional properties of human haematopoietic cells, unlike previous animal models properties of human haematopoietic cells, unlike previous animal models immunologically dysfunctional; in addition the transgenic mouse provides a unique model system which supports T cell development in a manner which more closely resembles normal ontogeny, as they possess CD4+T cells in the periphery that exhibit MHC-restricted antigen-specific responses. Sequences AAR76132-AAR76192 represent human cytokine PCR primers used in the development of human cytokine-expressing transgenic mice mouse may be used as a model for determining the allergenicity of non-\$**X**&

Determining a toxicological response to an agent, useful for screening of drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity

Claim 1; Page 332; 455pp; English.

toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity, and so determining the presence of a toxic response to the agent. Also described: (1) an array comprising one or more polynucleotides selected from the genes corresponding to the partial sequences given in ABZ82842 The present invention describes a method (M1) for determining a ABESULT 150

or New recipient mammal, preferably a mouse, useful as a model of human disease to assess efficacy of therapeutic or prophylactic treatments, for facilitating production of donor-specific functional immunity.

Example; Page 36; 70pp; English.

a digruption in both alleles of a gene such that lymphocyte maturation does not occur and exogenous cytokines. The cytokines are selected from: interleukin-3 (IL-3), interleukin-6 (IL-6), interleukin-7 (IL-7), macrophage-colony stimulating factor (M-CSF), granulocyte-colony stimulating factor (SECF), prem call factor (SECF), leukaemia inhibitory factor (ILF) and oncostatin M (OM). The gene disruption is in a gene that modulated VDJ recombination e.g. a RAG gene. The gene is disrupted by present invention relates to a new transgenic mouse, which comprises

insertion of a transgene comprising major histocompatibility complex (MHC) Class II DR3 and DQ2 genes. The transgenic mouse is useful as a model of human disease to assess efficacy of therapeutic or prophylactic treatments, or to assess the antigenic potential of compounds. The transgenic mouse is also useful for supporting donor hasmatopoietic stem cells or facilitating production of donor-specific functional immunity. PCR primers ACC42571-ACC42639 were used to generate the transgenic mouse

```

```
The invention relates to an isolated NOVX polypeptide selected from NOV1-
NOV27 polypeptides, a mature form of NOVX, a variant of NOVX or a
NOV27 polypeptides, a mature form of NOVX, a variant of NOVX or a
CE fragment of NOVX. Also included are determining the presence or amount of
NOVX in a sample (by using an antibody that immunospecifically bind to
the polypeptide), determining the presence of or predisposition to
the polypeptide with altered levels of NOVX in a first mammalian
subject, identifying a potential therapeutic agent for use in the
treatment of pathology related to aberrant expression of physiological
interactions of NOVX, screening for a modulator of activity or of latency
or predisposition to a pathology associated with NOVX, the nucleic acid
encoding NOVX, vectors and host cells. NOVX is useful for identifying an
agent (a cellular receptor or downstream effector) that binds to NOVX.

NOVX and NOVX mucleic acids are useful for treating or preventing NOVX.

associated disorders in humans, and in the manufacture of a medicament
for treating a NOVX related disease human disease e.g.
adrenoleukodystrophy, congenital adrenal hyperplasia, haemophilia,
hypercoagulation, idiopathic thrombocytopaenic purpura, autoimmune
disease, allergies, immunodeficiencies, transplantation, von Hippel-
Lindau (VHL) syndrome, Alzheimer's disease, cerebral passy, cuburous solerosis,
leach Novy and control of the passes of the parkinson's disease, cerebral passy, cuburous solerosis,
leach Novy and control of disease, cerebral passy, entired the manufacture of a medicament
control of the part of the passes of the cerebral passy, entired the control of the cerebral passy, control of the cerebral passy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ·,

The present invention describes a method for predicting marbling in bovine comprising identifying a haplotype that is predictive of marbling, where the haplotype comprises a single nucleotide polymorphism (SNP) at nucleotide 244 and/or 575 of the bovine somatostatin (SST) gene. Also described is a method for predicting a trait in bovine comprising identifying a haplotype that is predictive of the trait, where the haplotype comprises a SNP at nucleotide 244 and/or 575 of the bovine SST gene, and the trait is selected from yearling weight, actual fat thickness over 10th and 11th rib, quality grade, connective tissue, themethods can be used for identifying a haplotype comprising a SNP that is predictive of marbling is used for predicting marbling in bovine. Identifying a haplotype comprising an SNP that is predictive of a trait, is used for identifying a trait in bovine, e.g. yearling weight, actual fat thickness over 10th and 11th rib, quality grade, connective tissue, flavour and juiciness. Selecting a first parent bovine that has a haplotype predictive of increased marbling increased marbling increased marbling breeding bovines to produce offspring that exhibit increased marbling. The methods are useful for determining breeding characteristics of livestock for improving feedlot performance and meat mainty when we have a second produce offspring the management and marketing of livestock for improving feedlot performance and meat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             quality. The present sequence represents a bovine SST gene SNP probe, which is used in the present invention. The bovine SST gene is located on
Predicting marbling in bovine, useful for determining breeding characteristics of livestock progeny comprises identifying a haplotype that is predictive of marbling, where the haplotype comprises a single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 22 BP; 6 A; 8 C; 6 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chromosome 1, more specifically to 1q32.
                                                                                                                                                                                                                                                                                                                                        Claim 38; SEQ ID NO 24; 113pp; English.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 138; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The concleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule of possessing an NCH motif), a G-cleaver (cleaving RNA with a NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^22+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the call and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more creat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma immunodeficiency virus) associated NHL, immule-cell cumune thrombocytopaenia, and inflammatory arthropathy. The NOGO gene in the createsting nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the contaction that is preferably Mg^24. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may further comprise the use of one or more contacted with a cell to reduce of a contacted with a contacted with the level of the nucleic acid may further comprise the use of one or more contacted with a contacted with a cell to reduce of a contacted with a contacted with a cell and creat a patient having a condition associated with the level of the nucleic acid may further comprise the use of one or more contacted. therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central hervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease

of CD20 in the presence of a divalent cation that is preferably Mg^2^+.

CC Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma immunodeficiency virus) associated NHL, lymphocytic lymphoma, leukaemia, HUV (human immunodeficiency virus) associated NHL, lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immuno than in informatory arthropathy. The NOGO-coll adivalent cation that is preferably Mg^2^+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO gene in the coll and treat a patient having a condition associated with the level of the NOGO-treated with a cell to reduce NOGO activity of the coll and treat a patient having a condition associated with the level of the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident collowate in the collowate in the preferably acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke). Altheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chisease, muscular dystemer disease, chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chisease, muscular dystemer disease, chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides, The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression of the nucleotides.

Kaneko H,

Komai K,

Oligo:nucleotide which hybridises to human cytochrome P450IIC18 gene for detection of mutation(s) in the gene when establishing safe medication dosage in individual patients.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3056, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

Claim 5; Page 20; 34pp; Japanese.

The oligos AAQ94315-27 which hybridise to the human-derived cytochrome P450IIC18 gene, esp. to the gene having a point mutation at position 204 in exon 2, can be used as PCR amplification primers which discriminate

.;
between the normal and mutated gene, allowing the degree of genetic polymorphism in a patient to be determined. As the gene prod. participates in the metabolism of medicines (e.g. tricyclics, benzodiazepines, beta blockers and barbiturates), patients with mutant genes differ in their drug metabolising ability and therefore knowledge of this allows the safe dosage of medicine to be more accurately assessed

AA237473-237738 represent human mdm2 phosphorothioate oligonucleotides. AA23741, AA23742, AA237739, AA237740 and AA237741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compounds used to treat eg. hyperproliferative conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human NOVINTRA C DNA specific forward primer of primer-probe set Ag903.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR primer AAA58883-84 were used to amplify DNA encoding a BU101 polypeptide. The BU101 gene is transcribed from breast tissue. The specification describes a method for detecting the presence of a target BU101 polynucleotide in a test sample. The method comprises contacting the sample with at least one BU101-specific polynucleotide (AAA58875-80), and detecting bound polynucleotides. The method and BU1010 polynucleotides are useful for detecting the presence of BU101 polynucleotides. The methods may be used for the diagnosis of breast disease, indicated by the formation of complexes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting presence of target BU101 polynucleotide in sample useful for detection of breast cancer, comprises contacting sample with BU101-specific polynucleotide and determining binding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides novel polypeptides (NOVX) selected from human transmembrane protein (NOVTRAN), neuromedin peptide (NOVNEUR), gonadotropin-like protein (NOVGON) and two interleukin-1 receptor antagonist proteins (NOVINTRA A and E). The invention also provides methods in which a NOVX polypeptide, polymoleotide and antibody are used in the detection, prevention and treatment of a broad range of pathological states. NOVTRAN can be used to treat is a cell signaling disorder such as cancer, immune response disorder, hematopoietic disorder, neurodegenerative disorder, neurologic disorder, cancers of central nervous system, breast, colon, ovary, kidney, prostate and central nervous system, breast, colon, ovary, kidney, prostate and metabolic function disorder and melanoma. NOVINTRA A and B can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        treat bone metabolism or structure disorder, inflammatory response disorder, immune regulation disorder, septic shock, stroke, diabetes, arthritis and cancer. Sequences ARR83877-79 represent a primer-probe set Ag903 specific for the NOVINTRA C nucleic acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated human transmembrane, neuromedin peptide gonadotropin-like protein and interleukin-1 receptor antagonist proteins, useful for treating cancer, immune response disorder, metabolic function disorders.

                                                                                                                                                            Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
                                                                                                                                                                                                                                                                                   The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro. The hyperproliferative disorder includes cancer or psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New proteins, peptides and DNA for treatment of bronchial asthma, chronic occlusive lung disease and infectious disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the sequence of a protein which can be used in the treatment and prevention of infectious diseases. Inhibitors of the protein can be used to treat bronchial asthma and chronic occlusive pulmonary disease. The present sequence is a PCR primer

The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2. They may be used for treating as animal having the convexpression of mdm2 are so, a hyporprolification of mdm2 gene or (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to antisense compounds, 8-30 nucleobases in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cleobases targeted a region (e.g. translation termination codon region) a nucleic acid encoding human mdm2.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) a clones of the genomic libraries contained in comprises; (b) a primer designed based on the chromosome marker multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal ocrresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell confirming the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell confirmination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified and lateral directions; (f) the mixed clones are cultured and the capultant cultures are amplified by using the above primer; (g) signals are detected from the amplified broducts; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABLA2957 to ABLA5323 represent PCR primers for human chromosome 1036-35 DNA, and ABLA5323 to ABLA5534 crepresent PCR primers for human chromosome 21q221, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .
and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting the role of mdm2 expression in various cell functions and physiological processes and useful in both clinical research and diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated NOVX polypeptide, chosen from human transmembrane (NOVTRAN), neuromedin (NOVNEUR), gonadotropin (NOVGON), interleukin-1 (IL-1) receptor antagonist (NOVNITRA A and B), and IL-1 epsilon proteins. NOVX polypeptides have nootropic, cytostatic, neuroprotective, antiinflammatory, antibacterial, immunosuppressive, erebroprotective, antidiabetic, antiarthitic, antiasthmatic and antiallergic activities, and can be used in gene therapy and antibody based therapy. NOVX polypeptides, nucleic acid (I) encoding them and an antibody (III) that binds the polypeptide, are useful for treating or
                                                                                                                                                                                                                                                                                                                                                                                  Human; transmembrane protein; neuromedin protein; gonadotropin protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New NOVX proteins for diagnosing or treating cell signaling, immune response, hematopoietic, neurodegenerative, muscle, endocrine, bone, reproductive development disorders.

. 0 epsilon protein is useful for treating a lung disease such as lung cancer, asthma, emphysema, allergic lung irritation and lung inflammation in a mammal. ABQ73996 to ABQ74027 and ABP51981 to ABP52048 represent central nervous system cancer, breast, colon, ovarian, kidney, prostate or thyroid cancer. NovGON can be used in the treatment of a reproductive development disorder, metabolic function disorder or melanoma. NoVINTRA proteins can be used in the treatment of and a bone metabolism or structure disorder, an inflammatory response disorder, an immune regulation disorder, septic shock, stroke, diabetes, arthritis or cancer. An agent which modulates the expression or activity of a human IL-1 Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiathamatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or preventing a NOVX protein-associated disorder in humans. NOVTRAN can be used in the treatment of a cell signalling disorder, such as, a haematopoietic disorder or a neurodegenerative disorder. NOVNEUR can be used in the treatment of an endocrine, muscle, neurological disorder, Gaps Pabalan J, Aguilar D; . 0 sequences used in the exemplification of the present invention dysfunction; nasal airway dysfunction; Score 15.4; DB 1; Length 20; Pred. nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antinflammatory, antiallergic, antiasthmatic, hypotensive, composition may have a immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also composition as the prophylactic or therapeutic respiratory effect of an antinflammatory steroid in a subject, for reducing or depleting levels of or, or reducing sensitivity to adenosine, reducing or depleting levels or creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, tibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apopicosis, and for increasing expression of p21. The present DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compound targeted to 5' untranslated region, coding region, or intron.exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting

This sequence represents a PCR primer for the interleukin-4 (IL-4) gene. The invention relates to a method for inducing or enhancing an immune or cytokine response to a pathogen in neonates by administering IL-12 and an antigen (Ag) of the pathogen. The method is used to immunise against pathogens, bacteria, viruses, parasites, fungi and yeasts, for prevention and treatment of infection, especially against influenza but also against many common childhood diseases. IL-12 is an adjuvant that induces or enhances both cytokine response (particularly expression of interferongamma and IL-10) and humoral response (particularly increased expression of IgG1, G2a and G2b) and induces memory for protective responses early in life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, secreted protein; treatment; nutritional activity; cytokine; cell proliferation; cell differentiation; hematopoiesis regulation; tissue growth; activin; inhibin; chemotactic; chemokinetic; hemostatic; thrombolytic; anti-inflammatory; invasion suppressor; tumor inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing an immune, or cytokine, response in neonates by administering interleukin-12 and a pathogen-derived antigen, particularly for protection against influenza.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Pabry's disease, familial hypercholesterolemia, polycystic Kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longwity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid susceptibility and susceptibility or receptivity to particular contains and also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primer; immune response; cytokine response; pathogen; neonate; IL-12;

                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                               This invention describes novel human secreted proteins which are encoded by polynucleotides obtained from fetal brain, adult skin, adult brain, adult heart, adult thymus and adult acrta cDNA libraries. The adult thymus and adult acrta cDNA libraries. The polynucleotides and predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and call proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, hematopoises regulating activity, tissue growth activity, activity, hemostatic and thrombolytic activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, creeptor/ligand activity, anti-inflammatory activity, cadherin/tumor invasion suppressor activity, and tumor inhibition activity. The polynucleotides are also stated to be useful for gene therapy, AAZ43809-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;
                                                                                                                                                             New polynucleotides encoding secreted human proteins, derived from human fetal brain, adult skin, adult brain, adult heart, adult thymus and adult aorta cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse; IFN-gamma; interferon gamma; interleukin 10; interleukin 4; IL; immunosuppressive; PCR primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mediated immune response in vertebrate species using vertebrate submucosa. The submucosa elicits the inherently benign T helper lymphocyte-2 response and suppresses the T helper lymphocyte-1 response. RNA analysis of interferon gamma, interleukin 10 and interleukin 4 was used to determine the immune response to pig submucosa implantation in mice. The present sequence is the interleukin 4 sense primer. The method of the invention is useful for suppressing cell mediated immune response in autoimmune disorders. It is also useful for moderating immune response of vertebrate species to an implanted xenograft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                            Suppressing cell mediated immune response and protecting immunogenic biomaterials from the host immune system using vertebrate submucosa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This invention relates to the sequence of an isolated nucleic acid
molecule comprising at least one base variation from that of a known
human cytochrome P450 Al (CYP4501Al) cytochrome P450 A2 (CYP4501Al),
cytochrome P450 02E1 (CYP4501Al) cytochrome P450 A2 (CYP4501Al),
cytochrome P450 02E1 (CYP4501Al) adrenagic receptor betal (ADBR1),
cytochrome P450 02E1 (CYP4501Al) adrenagic receptor nuclear translocator
aryl hydrocarbon (ARR), APL hydrocarbon receptor nuclear translocator
(ARMY), catheppin S (CYS3), cyclocogenaee 2 (COX2), diazepam binding
inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5.1ipoxygenaee activating
transferase (HWMT), MADPH quinone oxidoreductaee 2 (NQ22),
transferase (HWMT), MADPH quinone oxidoreductaee 2 (NQ22),
sulfotransferase thermolabile (SYM), UND-glucuronosyl transferase 2B4
(UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
transferase (UGT2B1S), urokinase receptor (URA), multidrug resistance 1
(MRB1), actotransferain (LTP), multidrug resistance as secoiated procein 3
sulfotransferase for locating and characterising nesistance 1
(MRB1), lactotransferain (LTP), multidrug resistance as escointed procein 3
creeptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence
(MRB1), actobransferain (LTP), multidrug resistance 1
(MRB1), actobransferain (LTP, MRR3), CHMR4 or CHMR5) sequence
(Genetic Linkage markers for locating and characterising the genes that
are responsible for specific ratis within the genome and eventually
identifying the genes responsible for a variety of disorder-related
creating the disorders. The nucleic acid molecules comprising
cand/or treating the disorders. The nucleic acid molecules comprising
cand/or treating the disorders. The nucleic acid molecules
contains and/or MRB3 are useful for acreening individual for altered dary
me . 0 Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for Gaps ; DB 1; Length 21; 1; Indels primer used to amplify the sequences of the invention Sequence 21 BP; 3 A; 1 C; 4 G; 13 T; 0 U; 0 Other; Score 15.4; DB 1; Pred. lactis oligonucleotide #95 used in Long Range PCR. Lactococcus

Biosynthesis; biodegradation; lactic bacterium; yogurt; cheese; ss.

Lactococcus lactis; IL1403

0; The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. The present sequence is an oligonucleotide used in an example from the invention. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that constributes to the survival or growth of a fungus, a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, activity to inhibit growth or proliferation of c. albicans cells and for treatment used in the method of the invention. Note: The sequence data for translating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                        Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis,

                                                  PCR primers AA201426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion epidymitis, genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis, pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                  he polypeptides of the invention may be of use in treating these

against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, penital is cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584 - AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae and brombiae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent citis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX3454- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae

The present sequence is that of the Fas ligand promoter in the region by nucleotide -205. A C/G single nucleotide polymorphism (SNP) has been dentified at -205. Donors homozygous for -205G (present sequence), concors homozygous for -205G (present sequence), chomozygous for -205G (see AAA27438) and heterozygous for -205G/T (see AAA27539) have been identified. The present invention is based on the finding that single nucleotide allelic polymorphisms in a Fas promoter or resistance to the immune system through Fash expression, and infectious disease susceptibility. A method for identifying the Fas or Fas ligand promoter single nucleotide allelic pattern involves testing DNA from individual patients for the presence of different allelic variants and haplotyping the individuals for a series of SNPs suggestive of a controller disease. Polymorphisms have been identified at positions -844, -756, -478 and -205 of the Fas ligand promoter. TAAG and TGAG haplotypes at these positions are associated with individuals suffering from systemic lupus erythematosus in greater than 90% of a diagnosed disease construction are associated with individuals suffering high crisk individuals that warrant early treatment. An SNP within a Fas promoter or Fas ligand promoter gene of an individual can also be used for determining succeptibility of the individual can also be used for determining the control of the factor of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining autoimmune disease or cancer susceptibility especially useful for promoting early therapeutic intervention and for gene therapy comprises haplotyping an individual in a Fas promoter and Fas ligand
                                                                                                                                                                                                  /standard_name= "single nucleotide polymorphism"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        specifically autoimmune disease and non-lymphatic cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 20 BP; 3 A; 0 C; 9 G; B T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide probe for human DNA clone vol6 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Invention, which contain a polymorphic base at position 24 of their invention, which contain a polymorphic base at position 24 of their uncleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallellic markers. The biallellic markers of the invention primers for the biallellic markers. The biallellic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies the human genome, and in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents methods, as well as the characterisation of the differential efficacions responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

Novel proteins and polypeptides useful for the treatment of e.g multiple sclerosis, systemic lupus erythmatosus, rheumatoid arthritis, cancer, Alzheimer's disease, Parkinson's disease, stroke, anemia and ulcers.

Disclosure; Page 470; 493pp; English.

This invention relates to 59 human secreted proteins and the nucleotide sequences encoding them. Sequences AAC59788-C59846 and AAB34687-B34745 represent the proteins and their encoding nucleotide sequences, and sequences AAB34746-B34771 represent fragments of the proteins. Probes for the DNA sequences are represented by sequences AAC59847-C59596. The proteins exhibit neuroprotective, dermatological, immunosuppressive, antiinflammatory, antinfanemic, nootropic, antiparkinsonian, carebroprotective, haemostatic, notropic, antiparkinsonian, carebroprotective, haemostatic, notropic, antiparkinsonian, carebroprotective, haemostatic, sequences are useful as nutritional sources or supplements and in research. The proteins are useful for treating immune deficiency and disorders such as multiple sclerosis, systemic lupus erythmatosus, rheumatoid arthritis, and for treating myeloid or lymphoid cell deficiencies such as anaemias by regulating haematopoiesis. The proteins are also useful in compositions for bone, cartilage, tendon, ligament and/or nerve tissue growth or regeneration, for wound healing, tissue crepair and replacement and in the treatment of central and peripheral energy and merve and partines such as Alzheimer's and Partines's such as all median and metripair and mervely and mervely and mervely and mercely and mer diseases and Shy-Drager syndrome, and mechanical and traumatic disorders, such as spinal cord disorders, head trauma and stroke. The proteins may also be used as a contraceptive, and for treating cogulation disorders such as haemophilias. The protein and mucleotide sequences with cadherin activity are useful for treating cancer. Other uses for the protein include for inhibiting the growth, infection or function of, or killing, infectious agents such as bacteria, virus, fungl and other parasites, for effecting bodily characteristics such as height, weight, hair colour, effecting biorhythms or cardiac cycles or rhythms, effecting metabolism, catabolism, anabolism, processing, utilization, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, cofactors, effecting behavioural characteristics, providing analgesic effects and for treating hyperproliferative disorders such as psoriasis

Cowsert LM; Bennett CF,

Antisense oligonucleotides, useful for modulating the expression of Y-box binding protein 1, as well as for treating or preventing diseases associated with Y-box binding protein 1 expression, e.g. inflammation or WPI; 2001-023284/03

Claim 3; Col 45-46; 40pp; English.

tumor formation.

to the human Y-box binding protein and which inhibit its expression.

The antisense order of protein I gene, which inhibit its expression.

Of the human Y-box binding protein I mRNA, and were analysed for their effect on Y-box binding protein I mRNA levels by quantitative real-time of the human Y-box binding protein I (also known as YB-1, DNA binding protein B and dbpB) is a member of the Y-box binding protein Early of transcription factors, a highly conserved family of nucleic acid binding proteins which bind to the Y-box, an inverted CCAAT sequence found in the proteins which bind to the Y-box binding proteins have a broad specificity of prometres of many genes. Y box binding protein a broad specificity and single-stranded DNA and RNA. Y-box binding protein I plays a role in DNA repair and the sensitisation of cells from a diverse array of genetoxic stresses, including DNA cross-linking agents and ultraviolet irradiation. Y-box binding protein I is also involved in immune regulation, being a negative regulator of MHC (major histocompatibility). Sequences AAC81326-C81405 represent antisense oligonucleotides targetted complex) gene expression, and additionally modulates viral gene expression. It also participates in the regulation of extracellular matrix degradation, and is thought to be involved in redox signalling. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with Y-box binding protein 1 expression, such as tumour formation, cancer multidrug resistance, inflammation, immune disorders and certain infections

Sequences AAC92649-C92728 represent antisense oligonucleotides targetted to the human NCk-2 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human NCk-2 mRNA, and were analysed for their effect on NCk-2 mRNA levels by the control of the state of the human NCk-2 mRNA, and were analysed for their effect on NCk-2 mRNA levels by quantitative real-time PCR. NCk-2 (also known as NCk adapter protein, nCk-2 contains both SH2 and SH3 src homology domains and functions as an adapter protein integrin. mediated and receptor functions as an adapter protein in integrin. Particularly in growth factor receptor signal transduction, participates in pathways that connect growth factor receptor signalling and integrin signalling via its interaction with PINCH, a LIM domain-containing adapter protein which is involved in integrin, growth factor and wht signalling pathways. NCk-2 also interacts with EGF (epidermal growth factor) and PDGF (platelet-connect growth factor) receptors, inhibiting EGF- and PDGF stimulated DNA synthesis in an SH2-dependent manner. NCk-2 is also able to interact with cy-Abl, Ras and Sos proteins to induce transcriptional activation, and is therefore implicated in the development of cancer, particularly leukaemia and breast cancer. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with NCk-2 expression, such as leukaemia and breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound which inhibits expression of human nck-2 useful for treating disease or condition associated with expression of nck-2, and as research reagents, kits and diagnostics.

(G) at position 14113 is replaced by thymidine (T). The invention also describes (I) detecting or determining the copy number of (I) in humans, comprising determining the nature of the base at position 14113 in one or both alleles; (2) disagnosing or assessing the risk of diseases involving cell prolliferation, comprising genotyping individuals for the c-myb gene by the method of (I); and (3) a test kit for diagnosing or assessing the risk of diseases involving cell prolliferation, comprising human genomic DNA or RNA, primers for amplifying nucleic acid sequences containing the risk of diseases involving cell prolliferation. The products of the invention can be used in assays and test kits for detecting or determining the commer of (I) in humans, useful for diagnosing or assessing the risk of diseases involving cell prolliferation, including atherosclerosis, concers, vascular diseases, diseases involving anglogenesis, infections, diseases involving anglogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New 14113 T variant of the c-myb gene, useful as a target for diagnosing or assessing the risk of proliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel human c-myb gene (I) in which guanosine

The invention relates to a method for producing transgenic animals by inserting a heterologous gene into a testicle, such that progeny animals express the transgene constructs used in the invention contained the human growth hormone (hGH) gene, the human growth hormone receptor (hGHR) gene, or the rat mOB gene. Liposomes containing the transgene construct were prepared, and injected into the testicles of a male Korean sheep. Transformed progeny sheep were produced by harvesting the sperm and using it to fertilise a female sheep. Sequences AAH76944 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate a portion of the rat mOB gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence ragged site; STS; osteoporosis, osteopathic; gene therapy; antisense therapy; vaccine; bone disorder; Paget's disease; adapter; sclerostosis; osteomalacia; fibrous dysplasia; PCR primer; linker; ss

The invention relates to novel ABCC11 nucleic acids and proteins. ABCC11 sequences are used in the manufacture of a medicament for treating and/or preventing subjects affected by paroxysmal kinesigenic choreoachetosis. They may be used for treating or preventing subjects affected by a dysfunction of the transport of anionic drugs such as methotrexate, neutral drugs conjugated to acidic ligands such as GSH, glucuronate, or sulphate conjugated drugs. Compositions comprising the ABCC11 polypeptide may also be used in the treatment and/or prevention of a deficiency in the transport of cholesterol or inflammatory lipid substances and diseases mapped on the chromosome locus 16q12. ABCC11 protein can be used to treat pathologies linked to the transport of lipophilic substances. The invention is used in gene therapy. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; Van Buchem's disease; genomic deletion; craniotubular hypertosis; autosomal recessive disorder; chromosome 17; chromosome 17q21; bone dysplasia; 92Kb gene fragment; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Methods for identifying subjects who are afflicted with or carriers of diseases associated with genomic deletion(s), e.g. Van Buchem's disease, by determining the presence of a deletion in the 92 kb region of human
New ABCC11 nucleic acids and proteins, useful in manufacturing a medicament for treating and/or preventing paroxysmal kinesigenic choreoathetosis, or pathologies linked to the transport of lipophilic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to methods for distinguishing between individuals homozygous for and therefore afflicted with Van Buchem's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human chromosome 17 92Kb gene fragment amplifying PCR primer, 12158

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ÷
                                                                                                                                                                                                                                                                                                                                                 The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Paget's disease, sclerostosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82038

Buchem's disease and individuals who are not afflicted with Van Buchems's disease comprise identifying a large genomic deletion in chromosome 17 at 1791. The method is useful for identifying individuals who are afflicted with or carriers of diseases associated with one or more genomic deletion, particularly Van Buchem's disease, which is a rare autosomal recessive disorder that results in a bone dysplasia referred to a craniculular hypertosis. The present sequence is a PCR primer used to amplify 92Kb gene fragment in human chromosome 17 at 17921
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 brain injury; neurodegenerative disease; infection; inflammation; tumour;

                                                                                                                                                                                                                                                                              à
```

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 2, which specifically hybridises with and inhibits the expression of caspase 2, or specifically

Claim 3; Page 102; 146pp; English.

```
hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding caspase 2. The activity of antisense of oligomucleotides of the invention may be described as. cytostatic, osteopathic, cerebroprotective, neuroprotective, antilipemic, antilinflammatory and antimicrobial. The antisense compounds are useful for treating an animal having a disease or condition associated with caspase 2, such as haematopoietic disorder, bone metabolism disorder, cholesterol disorder, or a hyperproliferative disorder. These compounds may further be used as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway, in the treatment of a disease or disorder which can be treated by modulating the expression of caspase 2, including cancer, blood disorders, stroke, brain in fully and neurodegenerative diseases. They may also be used for prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. Records ABN74810-ABN74952 represent caspase 2 mRNA inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; mouse; Zmax1; HBM; high bone mass gene; lipid regulation; stroke; lipid-associated condition; arteriosclerosis; cardiovascular disease; ss; osteoporosis; atherosclerosis; diabetic atherosclerosis; plaque bulid-up; neurovascular condition, wound healing; gene therapy; PCR primer; probe; bone development disorder; antiarteriosclerotic; cardiovascular; osteopathic; cerebroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmaxl. Compounds identified by the method are useful for treating,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying molecules involved in lipid regulation, useful for diagnosing, treating or preventing e.g., arteriosclerosis, comprises identifying a molecule that binds to high bone mass gene or its corresponding wild type gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                             ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for amplifying a nucleic acid using Single Primer Amplification (SPA). The method comprises synthesising a template nucleic acid containing a predetermined sequence and hairpin structure with the nested oligonuclectide extension reaction. The method is useful for amplifying a nucleic acid, preferably for amplifying a family of related nucleic acid sequences to build a complex library of polypeptides encoded by the sequences. The engineered nucleic acid strand is useful for amplifying a nucleic acid strand by providing a nucleic acid with a predetermined sequence engineered onto its first end, a acid with a predetermined sequence end a hairpin structure between them and contacting the engineered nucleic acid strand with a primer containing at least a portion of the predetermined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amplifying nucleic acid by synthesizing template nucleic acid containing a predetermined sequence and hairpin structure and using the template for target amplification by Single Primer Amplification.
                                                                            conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmaxl and HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA molecules encoding human Zmaxl and HBM, and PCR primers, probes, linkers
                       associated conditions, including arteriosclerosis, cardiovascular disease, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Single Primer Amplification, nested oligonucleotide extension reaction, hairpin, SPA, library, ds.

oligonuclectide probes (II) will hybridise with little mismatch, where oligonuclectide probes (II) will hybridise with little mismatch, where oligonuclectide probes (II) will hybridise with little mismatch, where clips are melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. Te-coll lymphocytorrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracumculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from ERCAH gene, buman papillomavirus types 16 and 18 and liver cancers. The
                                                                                                                                                                                                                                                                                       ö
sequence. This process is done in the presence of a polymerase and nucleotides under conditions suitable for polymerisation to produce a complementary nucleic acid strand. The method of the invention is useful for producing large amounts of a target nucleic acid sequence and for amplifying simultaneously more than one different target nucleic acid sequence located on the same or different nucleic acid molecules. This polynucleotide sequence represents an oligonucleotide relating to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ligame detection reaction, LDR; p53; BRCAI; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus, forensic; environmental monitoring; food industry; feed industry; ss.

method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target molecinde sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; K-ras, PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method (M1) for designing capture oligonuclectide probes (1) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                            ;

(1) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and

Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamocba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The

```
a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel or orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA configuration and therapeutic purposes. The oligonucleotides can be sected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively,
                                                                                                                                                                                                                                                                                           ·;
method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to methods and oligonucleotides for forming

A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression.

Example 8; Fig 27; 108pp; English.

The present invention relates to methods and oligonucleotides for forming artiple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to sepecifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for

pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The cell. WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 12598; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genemic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiashmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or

preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 228; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiashmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or

preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a new isolated nucleic acid sequence (I) comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also known as prolyloligopeptidase). (I) has antiinflammatory, antiasthmatic, antisposiatic, antiarthritic and antirheumatic activities, and can be used in vaccines and gene therapy. A composition comprising (I) can be used for the manufacture of a medicament for regulating DPP10 expression or for preventing or treating inflammatory disease e.g., inflammatory bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can

also be used in an assay for detecting or measuring DPP10 in a sample. A host cell comprising (I) can be used for producing recombinant DPP10 gene products, or in drug screening systems to identify agents for diagnosis or treatment of individuals having or susceptible to inflammatory disease. Human DPP10 is located on chromosome 2, more specifically chromosome 2414. ABQ84254 to ABQ84612 and ABP55569 to ABP55629 represent sequences used in the exemplification of the present invention

New transgenic animals (e.g. mice), useful as models for studying bone density modulation, developing drugs for treating or preventing bone diseases (e.g. osteoporosis), or diagnosing diseases characterized by reduced bone density

Disclosure; Page 56; 603pp; English

The invention relates to novel transgenic animals expressing the high bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comportabing an alteration of the gene encoding LRPs or LRPs, or expressing an LRPs that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or hone mass modulation. The invention has osteopathic and cytostatic activity. The polymuclectides of the invention may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same species in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The

transgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Pagett's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention

The invention relates to an antisense compound targetted to a nucleic acid molecule encoding phospholipid scrambiase I and which specifically hybridises with and inhibits the expression of phospholipid scramblase I, or which hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding phospholipid scramblase I. The invention is useful for inhibiting the expression of human phospholipid scramblase I in cells or tissues and for treating an animal having a disease or condition associated with phospholipid scramblase I, such as inflammation, an immune disorder and a hyperproliferative condition, e.g. cancer. The invention is useful for diagnostics, therapeutics and as research research
                                                                                                         Novel antisense compounds targeted to nucleic acids encoding phospholipid scramblase I, for modulating gene expression and treating inflammation, immune disorders and hyperproliferative conditions e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer extension chain reaction; reverse; forward; target nucleic acid; variant; HIV; HCV; HBV; Parvovirus B19; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
```

The invention relates to a novel method for a primer extension chain reaction for determining presence of a target nucleic acid molecule in a sample, where the nucleotide at 3' end of the reverse primer hybridises with nucleotide at 5' end of the forward primer extension product or a

extension product by a gap comprising a highly conserved nucleotide sequence. The method is useful for determining presence of a target nucleic acid molecule known to have variant sequences, in a sample. The target nucleic acid is preferably a virus including human immunodeficiency virus (HIV), hepatitis C virus (HCV), hepatitis B virus (HBV) or Parvovirus B19. This polynucleotide sequence represents a PCR primer used in the primer extension chain reaction method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses a polynuclectide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide of peptide of the polynucleotide by contacting the polypeptide or peptide between the two, a transformant carrying the polypucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotides and encoded
  nucleotide separated from the nucleotide at 5' end of the forward primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotides and polypeptides, useful for developing a diagnostic marker or medicines for regulation of their expression and activity, or

ö
       genes may be included in them. for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is clone specific PCR primer which was used in the expression analysis of the genes of the invention. Note: Some of the sequence data for this patent is not represented in the printed is patent is not represented in the printed of the invention supplied by the

The present invention relates to High Bone Mass (HBM), LRPS (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS)

New nucleic acid comprising a mutation in LRP5 or LRP6, useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject

                                                                                                                                                                                                                                                                                                                                The chicken Major Histocompatibility Complex (MHC) B-complex is comprised of three classes of loci. Class I was mutated by site directed mutagenesis. Transfected cells containing the mutant sequence may be generated. The heterologous BrIV protein produced by these cells may be used as an immunogen to produce chicken MHC class I specific antisera. This antisera may then be used to determine the BF haplotype of any chicken. BrIV specific antisera may be used to determine the B haplotype of chickens with reduced cross reaction with class I and class IV MHC proteins. The present sequence is the PCR primer B13M126.3, targeted to BFIV13. Alterations to this sequence created the primer used to mutagenise BFIV13 at positions 126 to 128
                                                                                                                                                                                                                                                    Producing antisera specific to major histocompatibility complex (MHC) proteins in chickens involves administering transfected cells expressing heterologous chicken MHC class I protein capable of eliciting immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```
The chicken Major Histocompatibility Complex (MHC) B-complex is comprised of three classes of loci. Class I was mutated by site directed mutagenesis. Transfected cells containing the mutant sequence may be used as an immunogen to produce chicken MHC class I specific antisera. This antisera may then be used to determine the BF haplotype of any chicken. BFIV specific antisera may be used to determine the BF haplotype of any chicken BFIV specific antisera may be used to determine the BF haplotype of chickens with reduced cross reaction with class I and class IV MHC proteins. The present sequence is the PCR primer BISML26.5, targeted to BFIVI3. Alterations to this sequence created the primer used to
                                                                                                                                                                    Producing antisera specific to major histocompatibility complex (MHC) proteins in chickens involves administering transfected cells expressing heterologous chicken MHC class I protein capable of eliciting immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human biallelic marker downstream amplification primer SEQ ID NO:9328.

Novel biallelic markers used to construct a high density disequilibrium

map of the human genome

Chumakov

```
invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N. B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                            AAZ65654 to AAZ69578 represent human biallelic markers from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human biallelic marker upstream amplification primer SEQ ID NO:6151

AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyphing studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

The present invention is concerned with a number of human single mucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                        Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid selected from one of 106 genes comprising single nucleotide bylymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to Detecting a collagen gene alteration associated with a pathological condition in a human subject by obtaining from the subject a sample nucleic acid containing a portion of at least 15 consecutive nucleotides of the segment of the COLLA1 gene extending in the 5 to 3' direction from 78 nucleotides of intron 27 located adjacent can strong the 3' and of intron 5', where the portion contains an intronic nucleotide and a first and second site, determining the sequence of the portion and comparing the sequence of the portion with the corresponding consensus sequence of the COLLA1 gene where a difference between the sequence of the portion and the consensus sequence con the presence of the portion and the consensus sequence in the presence of the collagen alteration in the subject. The method is used for determining whether a subject is afflicted with pathological conditions associated with an altered collagen gene such as osteoporosis, multiple casconated with an altered collagen gene such as osteoporosis, multiple companies of the collagen gene such as osteoporosis, multiple companies of the subject to correct or alleviate the collagen density. Identification of an abnormality in a collagen gene is also useful for designing a therapeutic nucleotide or gene therapy agent which can be administered to the subject to correct or alleviate the coding and non-coding sequences of any of the COLl or COL9 genes:

Therefore the presence of the presence of any of the COLI or COL9 genes.

Therefore the method can be used to detect collagen gene alterations which and the presence of the presence of any or the presence of the collagen gene alterations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              which affect either the primary sequence of a collagen protein chain, splicing of the mRNA encoding such chains or regulation of expression the genes encoding such chains. The present sequence is a PCR primer which amplifies a nucleic acid from a collagen gene of the invention
osteoporosis, multiple epiphyseal dysplasia; osteogenesis imperfecta; shortness of stature; low bone density; gene therapy; PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting collagen gene alteration, useful for diagnosing osteopor multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness stature and low bone density in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.4%; Score 15.2; DB 1; Length 21; 35.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the disagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a method of diagnosing a vascular disease
                                                                                                            polymorphism, vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention describes a method for determining the origin or identity of a human by: (1) determining polymorphic sites in the complete mitochondrial genome; and (ii) relating the results to mitochondrial sequence data of known origin. Also described is a kit for the process comprising a system for analysing all informative sites in the mitochondrial genome. The method is used for determining the geographical and ethnic origins of humans, also in medicine (identification of disease related mutations) and evolutionary blology (e.g. estimation of mutation rates). Analysis of the entire mitochondrial genome provides more accurate results than (as previously) analysis of the Diloop only,
                                                                                                                                                                                                                                                 Determining origin and identity of humans, useful e.g. for evolutionary studies, by analysis of polymorphisms in the complete mitochondrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Virucide; cytostatic; anti-HIV; dermatological; small interfering RNA; selective post-translational silencing; siRNA; oncogene; genital wart; human papilloma virus; HPV gene; cancer; human cervical cancer; HIV; smallpox; flu; common cold; cervical cancer; penile cancer; malignant squamous cell carcinoma; verruca vulgaris; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       particularly it defines clear haplotypes whereas the D-loop shows a jumbled arrangement of polymorphic sites. The present sequence represent primer used in the analysis of mitochondrial DNA (mtDNA) polymorphisms in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   *tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated non-typeable Haemophilus influenzae BASB201 polypeptides, useful as components of vaccines for treating bacterial infection such as otitis media, delayed speech learning and inflammation of middle ear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of several versions of the BASB201 protein from non-typeable Haemophilus influenzae. These can be used in the production of vaccines against H. influenzae infection, which can cause citis media in infants and children, pneumonia in elders, sinusitis, nosocomial infections, or accumulation in the middle ear, auditive nerve damage, delayed speech learning, infections of the upper respiratory tract and inflammation of the middle ear. The present sequence is a PCR primer used to isolate a version of the BASB201 coding sequence of the invention

The invention relates to a novel method for selective post-translational silencing in a mammalian cell of the expression of an exogenous gene of viral origin. The method comprises introducing into the cell a small interfering RNA (siRNA) construct that is homologous to a part of the care reasonable silencing of an exogenous gene of viral origin (e.g. an concogene or human papilloma virus (HPV) gene) in a mammalian cell. The concogene or human immunodeficiency virus (HIV), smallpox, flu, common cold, or a disease caused by a HPV (e.g. genital warts, cervical cancer, human immunodeficiency virus (HIV), smallpox, flu, common cold, or a disease caused by a HPV (e.g. genital warts, cervical cancer, penile cancer, malignant squamous cell carcinomas or verruca vulgaris). An siRNA construct or vector is useful for use as a medicament or the diseases mentioned: The polynucleotide sequence of the invention can be used to treat disorders by gene therapy. This polynucleotide sequence of the invention
                                                                                                                                                                                                                                                                                                                              Selective post-transcriptional silencing of an exogenous viral gene (e.g. human papilloma virus (HPV) E6), for treating e.g. cancer, comprises using a small interfering RNA (siRNA) construct homologous to an mRNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 lactic acid; lactate dehydrogenase; ethanol; pyruvic acid;

Method for producing lactic acid comprises culturing a transformant carrying DNA encoding a foreign protein which has a lactate dehydrogenase activity, in a culture bed containing glucose while controlling the production of ethanol

Disclosure; SEQ ID NO 30; 76pp; Japanese

The invention relates to a method of producing lactic acid comprising utilizing a transformant carrying DNA encoding a foreign protein which has a lactate dehydrogenase activity while controlling production of ethanol. The transformant also exhibits an affinity for a pyruvic acid substrate which is comparable to or even exceeds the affinity for a pyruvic acid substrate of the intrinsic pyruvate decarboxylase in the host. The foreign protein is a lactate dehydrogenase originating from cows, or its homologue. The method is for use for mass production of lactic acids. This sequence represents a PCR primer used to amplify a bovine lactate dehydrogenase gene which is codon optimised for expression in yeast cells.

skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBPJ), which is capable of inhibiting or reducing growth factor mediated cell proliferation, oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153-164516). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborhoea, keloids, keratosis, neoplasis, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood vessels or any other hyperplasia
